

Supplementary Fig. 1. Histopathological patterns seen in C3 Glomerulopathy. (A) Lobular accentuation with increased mesangial matrix and cellularity (mesangial and endothelial) distributed globally. Capillary walls show segmental double contoured appearance (periodic-acid-Schiff stain, X40). (B) Direct Immunofluorescence revealing granular deposits with C3 along the capillary walls and mesangium. (C) Ribbon like osmiophilic transformation of lamina densa in dense deposit disease.
